

AI vs the Human Brain

Much has been said about how Artificial Intelligence will eventually dominate and eventually take over the world. Everyone from the Late Stephen Hawking, to Bill Gates and more recently Elon Musk have said as much; that we need to be wary about letting too much AI into our lives. Others such as the futurist Ray Kurzweil suggest that we may be approaching a time when man and machine merge into one hybrid being, the Cyborg, at a time around thirty to fifty years hence, known as the Singularity.

This I believe is possible but quite unlikely. We humans have been around between 5 and 7 million years or so, and in that time we have picked up a few tricks of our own.

During this talk I outline the reasons why I believe that we still have a chance against the AI onslaught.

I have included my Power Point slides of the talk and hope they give you some sort of understanding for my optimism.
